Sequences of pentagonal numbers¹

Arun S. Muktibodh Mohota Science College, Umred Rd. Nagpur-440009, India.

Abstract Shyam Sunder Gupta [3] has defined Smarandache consecutive and reversed Smarandache sequences of triangular numbers. Delfim F.M.Torres and Viorica Teca [1] have further investigated these sequences and defined mirror and symmetric Smarandache sequences of triangular numbers making use of Maple system. Working on the same lines we have defined and investigated consecutive, reversed, mirror and symmetric Smarandache sequences of pentagonal numbers of dimension 2 using the Maple system.

Keywords Figurate number, Smarandache consecutive sequence, Smarandache mirror sequence.

§1. Introduction

Figurate number is a number which can be represented by a regular geometrical arrangement of equally spaced points. If the arrangement forms a regular polygon the number is called a polygonal number. Different figurate sequences are formed depending upon the dimension we consider. Each dimension gives rise to a system of figurate sequences which are infinite in number.

In this paper we consider a figurate sequence of pentagonal numbers of dimension 2. Henceforth, unless and otherwise stated, "pentagonal numbers" will mean pentagonal numbers of dimension 2.

The *n*-th pentagonal number $t_n, n \in N$ of dimension 2 is defined by $t_n = 2n + \frac{5}{2}n(n-1) - n^2$. We can obtain the first k terms of Pentagonal numbers in Maple as:

```
> t:= n->2*n + (5\2)*n*(n-1)-n^{2}:

> first := k -> seq(t(n), n=1...20);
   For example first 20 terms are:

> first(20);

1, 5, 12, 22, 35, 51, 70, 92, 117, 145, 176, 210, 247, 287, 330, 376, 425, 477, 532, 590
```

For constructing Smarandache sequence of pentagonal numbers we require the operation of concatenation on the terms of above sequence which is defined in Maple as;

¹This work is supported by UGC under Minor project F. No. 23-245/06.

```
> conc :=(n,m) -> n*10^length(m)+m:
We define Smarandache consecutive sequence \{scs_n\} for pentagonal numbers recursively as;
scs_1 = u_1,
scs_n = conc(scs_{n-1}, u_n)
Using Maple We have obtained first 20 terms of Smarandache consecutive sequence of pentag-
onal numbers;
> conc :=(n,m)-> n*10^length(m)+m:
> scs_n := (u,n) \rightarrow if n = 1 then u(1)else conc(<math>scs_n(u,n-1),u(n)) fi:
> scs := (u,n) -> seq (scs_n(u,i),i=1...n):
> scs(t,20);

                            15122235517092117
                           15122235517092117145
                        15122235517092117145176
                       15122235517092117145176210
```

15122235517092117145176210247 15122235517092117145176210247287 15122235517092117145176210247287330 15122235517092117145176210247287330376 15122235517092117145176210247287330376425 15122235517092117145176210247287330376425477 15122235517092117145176210247287330376425477532 15122235517092117145176210247287330376425477532590

The reversed Smarandache sequence (rss) associated with a given sequence $\{u_n\}, n \in N$ is defined recursively as;

$$rss_1 = u_1,$$

$$rss_n = conc(u_n, rss_{n-1}).$$

In Maple we use the following program;

```
> rss_n :=(u,n) -> if n=1 then u(1) else conc(u(n),rss_n(u,n-1)) fi:
> rss := (u,n) -> seq(rss_n(u,i),i=1..n):
```

We get the first 20 terms of reversed Smarandache sequence of pentagonal numbers;

> rss(t,20);

```

```

Smarandache Mirror Sequence (sms) is defined as follows:

$$sms_1 = u_1,$$

$$sms_n = conc(conc(u_n, sms_{n-1}), u_n).$$

The following program gives first 20 terms of Smarandache Mirror sequence of pentagonal numbers.

```
> sms_n := (u,n) \rightarrow if n=1 then
```

```
> u(1)
> else
> conc(conc(u(n), sms_n(u, n-1)), u(n))
> sms :=(u,n) ->seq(sms_n(u,i), i=1..n):
> sms(t,20);

    Finally Smarandache Symmetric sequence (sss) is defined as:
                        sss_{2n-1} = conc(bld(scs_{2n-1}), rss_{2n-1}),
                          sss_{2n} = conc(scs_{2n}, rss_{2n}), n \in N.
where the function "bld" (But Last Digit) is defined in Maple as:
> bld := n->iquo(n,10):
First 20 terms of Smarandache Symmetric sequence are obtained in Maple as:
> bld :=n-> iquo(n,10):
> conc := (n,m) -> n*10^{length(m)+m}:
> sss_n := (u,n) \rightarrow if type(n,odd) then
> conc(bld(scs_n(u,(n+1)/2)),rss_n(u,(n+1)/2))
> else
> conc(scs_n(u,n/2),rss_n(u,n/2))
```

> sss := (u,n) -> seq(sss_n(u,i), i=1..n):

> sss(t,20);

```

```

We find out primes from a large number (first 500 terms) of various Smarandache sequences defined so far. We have used Maple 6 on Pentium 3 with 256 Mb RAM. We first collect the lists of first 500 terms of the consecutive, reversed, mirror and symmetric sequences of Pentagonal numbers:

```
> st :=time(): Lscs500:=[scs(t,500)]: printf("%a seconds",round(time()-st));
16 seconds
> st :=time(): Lrss500:=[rss(t,500)]: printf("%a seconds",round(time()-st));
18 seconds
> st :=time(): Lsms500:=[sms(t,500)]: printf("%a seconds",round(time()-st));
50 seconds
> st :=time(): Lsss500:=[sss(t,500)]: printf("%a seconds",round(time()-st));
11 seconds
```

Further we find the number of digits in the 500th term of each sequence:

> length(Lscs500[500]),length(Lrss500[500]);

2626, 2626

> length(Lsms500[500]),length(Lsss500[500]);

5251, 2268

There exist no prime in the first 500 terms of Smarandache consecutive sequence of pentagonal numbers.

```
>st:= time():select(isprime,Lscs500);
> printf("%a minutes",round((time()-st)/60));
```

86 Arun S. Muktibodh No. 3

11 minutes

There are only two primes in the first 500 terms of reversed Smarandache sequence of pentagonal numbers.

```
>st:= time():select(isprime,Lrss500);
